Veer Jain

(847) 312-8337 | jain621@purdue.edu | linkedin.com/in/veerjain1 | Active Security Clearance

EDUCATION

Purdue University, West Lafayette, IN **December 2026**
B.S. in Computer Science & Artificial Intelligence (Double Major) **GPA: 3.8, Dean's List**

Certifications: AWS Machine Learning Engineer (2026), Microsoft Azure AI Apps and Agents Developer (2025)

Skills: Python, Java, C++, JavaScript, TypeScript, AWS, Azure, Red-Teaming, Docker, Kubernetes, Apache Kafka, Spark, Machine Learning Infrastructure, PyTorch, TensorFlow, RAG, LLMs (Bedrock), Agentic Orchestration, ReAct, SQL, Git, Jira.

PROFESSIONAL EXPERIENCE

Amazon Web Services (AWS) **Summer 2026**
Software Development Engineer Intern

- Shipped a multi-agent AI Security Analyzer using AWS Bedrock (AgentCore) and Anthropic models, automating vulnerability detection across complex codebases and IaC, reducing security review time by ~8 hours/deployment.
- Integrated adversarial red-teaming agents to cross-validate LLM findings, uncovering Sev-1 vulnerabilities in core infrastructure and reducing false-positive IAM alerts by over 40% through deterministic evaluation tools.
- Built an orchestration layer developed for parallelized analysis, utilizing AWS Fargate, API Gateway, AWS CDK, and DynamoDB to manage stateful, multi-step security workflows at enterprise scale with low latency.
- Engineered a closed-loop remediation pipeline integrating ReAct-based reasoning with an automated PR/ticketing system; implemented an agent evaluation framework with a 90% Precision/Recall threshold to gate production-ready findings.

Lockheed Martin **Summer 2025**
Software Engineer Intern

- Architected a scalable ML-inference platform for an AI-driven missile prototype, automating validation pipelines and optimizing backend microservices to reduce latency in defense-grade applications.
- Designed a data processing pipeline in Python and Spark for real-time streaming, integrating ML inference modules to detect distant small targets and feed a multi-object tracker over Kafka and SQL, cutting missed detections by 25%.
- Engineered end-to-end ML training infrastructure on Azure Machine Learning using GitLab CI/CD pipelines, augmenting real-world flight datasets via synthetic data generation; automated validation to cut testing cycles from 4 days to 3 hours.

Textron Systems **Summer 2024**
Software Engineer Intern

- Developed ML-based threat detection algorithms using causal inference and unsupervised learning for a Warfare Simulator; leveraged TensorFlow, PyTorch, and MySQL to resolve critical bugs and reduce false positive alerts by 35%.
- Collaborated with cross-functional stakeholders to deploy an AI-powered NLP tool, automating data intake processes to save 100+ hours monthly and establish it as a key company asset.
- Optimized MySQL schemas and indexing to reduce analytical query latency on threat-detection dashboards by 30%.

PROJECTS

AgentGuard – *github.com/veerjain-1/agent-guard-eval* **Fall 2026 – Current**

- Architected a deterministic evaluation engine in Python to audit autonomous agent execution traces, achieving sub-millisecond (<1ms) trace validation and eliminating recurring LLM-as-a-judge API evaluation costs by 100%.
- Engineered 5 runtime guardrails enforcing JSON Schema validation, AWS IMDS SSRF blocks, and n-gram loop detection, achieving a 100% detection rate across 20+ adversarial attack vectors.
- Built an automated DevSecOps pipeline using Docker and GitHub Actions; integrated SARIF and JUnit XML reporting to stream real-time vulnerability findings directly into GitHub Code Scanning to gate pull requests.

Agentic CI/CD Orchestrator – *github.com/veerjain-1/agentic-cicd-orchestrator* **Spring 2026 – Current**

- Designed an autonomous CI/CD orchestrator using Java (Spring Boot) and LangGraph to manage high-frequency commits; automated multi-stage build workflows and dependency validation, saving ~15 hours/month.
- Developed an asynchronous backend triggering recursive LLM agents for deep-dive code analysis; utilized message queuing to manage high-volume commits and generate automated, comprehensive PR summaries.
- Built a scalable agent controller managing stateful workflows across multiple environments; implemented observability using Prometheus/Grafana to monitor agent performance, resource consumption, and deployment reliability.
